This is the master control program that takes care of all the giFT controls: it is used by the main program and by the control manager. KEYMACRO has a graphic interface, as the rest of the control program. However, the controls are located at the very top of the screen.

i KCeasy Settings Menu: The settings menu allows you to change the name and user interface for KCeasy. **Keymacro Defaults:**

i Connection Settings: Connection settings allow you to specify settings for incoming connections and outgoing connections. The default settings are set up so that the giFT server is the first network that connects. To select a network you use the drop down menu, which allows you to select the network you want to use. If a network isn't available, it won't appear in the list, but you can still use that network by entering the address. There are a few advanced options for the connection settings. You can select different transfer methods. P2P options are a bit more complex. All networks support this feature. If a network isn't supported, it will tell you that in the menu. You can select whether or not giFT should start minimized or maximized. Setting this option is only available when installing giFT for the first time. The master control program does it automatically.

i Filter Settings: The filter settings allow you to define the filters that will be shown when you select a network in the transfer list. There are two ways to define filters: - By network name. In this case, you can filter by name. The network name is displayed above the list of networks in the filter list. You can only filter networks that are available on the current selection. - By network. In this case, the filter is based on the name of the network. To set up a filter, choose the network you want to filter and use the filter list to set the filter. The menu shows the filters available for the current selection. You can also open the filter menu and modify the filters there.

i User Settings: The user settings allow you to specify settings for KCeasy and KCeasy Controls. You can choose whether or not KCeasy
