Postpartum women receiving cesarean section (CS) usually have longer hospital stays and are at higher risk for complications and infections than women who gave vaginal birth. However, the postpartum period represents a time of great opportunity for promoting health behaviors and improvement of women's health and well-being. The aim of this study was to compare mothers who had received CS with those who had given vaginal birth regarding the physical and mental health indicators of the postpartum period. This cross-sectional study used a convenience sample of 300 women in northern Thailand. A structured questionnaire was used to collect data. A statistically significant difference was found in women's physical and mental health between the two groups. However, this study also showed that, although physical and mental health issues were present in the postpartum period, women who had given vaginal birth experienced more incidences of physical and mental health issues than did those receiving CS. The physical and mental health status of women was not good after CS; therefore, more attention should be paid to the 55cd1ed1c
